

# ATLAS Database Work Plan

**ATLAS Software Workshop**

**Berkeley, California**

**10 May 2000**

**David Malon  
malon@anl.gov**

## Near-term Priorities

- **Access to existing data**
- **Infrastructure for database creation, population, distribution, and development**
- **Mechanisms to support data access through the prototype control framework and its successors**
- **Initial detector description infrastructure, including detector component identification, and input geometry**
- **Datastore support for testbeams**

## Access to Existing Data

**This refers primarily to data from the physics TDR.**

**Related milestones:**

- **April 00: Geant3 digits available**
- **July 00: Geant3 hits available**

**Status report from RD later in this session**

## Infrastructure

**...for database creation, population, distribution, and development**

**Proposed milestones:**

- **June 00: SRT-based support for database creation with reference schemata**
- **August 00: Support for database distribution to secondary federations**

**Status report from RD later in this session**

## Data Access through Control Framework

### Related milestones:

- **September 00: Objectivity/DB data access through control framework**
  - Precise meaning to be determined in conjunction with architecture team
  - Involves both infrastructure definition/development and concrete physics data models (transient and persistent)
  - Tile testbeam data access initiative to begin May 00 (Calafiura/Malon)
  - Access to TDR data via Objectivity/DB needs prioritization **(but see Fabiola's milestone: end of 00)**

## Detector Description Infrastructure

**Including detector component identification, and input geometry**

**Related milestones:**

- **April 00: Shared identification conventions and definitions (STATUS: draft circulated in April; awaiting endorsement by subsystems--report from RD later)**
- **July 00: Revised identifier utility classes and utilities (STATUS: first version done in 1998; revision in progress)**
- **November 99: XML DTD for geometry (STATUS: done, with several subsequent revisions)**
- **Summer 00: XML geometry definitions from subsystems (STATUS: in progress; subsystems are responsible)**
- **November 99: XML DTD for materials, and XML materials definitions (STATUS: done; evolving to common implementation with LHCb)**

**XML status report from Stan later in this session**

## **Datastore Support for Testbeam**

### **Related milestones:**

- **July 99: Tile calorimeter testbeam pilot project using Objectivity/DB (STATUS: completed)**
- **July 00: RD5 calibration database infrastructure in place**
- **August 00: RD45 naming; support for user data areas in shared federation**
- **August 00: Testbeam data models (subsystems have primary responsibility)**
- **September 00: Current tile testbeam data model connected to control framework**
- **October 00: Tile and LAr data available through framework**

**Session devoted to testbeam on Friday**

## Other Database Activities

- **Viability assessment of ATLAS baseline datastore strategy to support technology decision in appropriate timeframe, which is ...**
  - 2001? (currently quoted by RD45)
  - 2002? (Computing TDR)
- **New hits and digits definitions, to support, for example, Geant4-related milestones)**
- **Grid-related database work**

## Viability Assessment of Baseline Database Strategy

In the current calendar year, the principal components of that effort are proposed to be:

- **Accumulation of a significant body of experience with Objectivity/DB**
  - based in part upon testbeam
  - specific technology use and evaluation
- **Reassessment of ATLAS requirements**
  - LHC common effort
  - ATLAS-specific, in conjunction with Architecture Team requirements effort
- **Evaluation of scalability/viability testing done by others**
  - RD45, CMS, BaBar
  - also experiments that have chosen not to use Objectivity/DB

This effort may require augmentation based upon review outcomes.

## Grid-related Database Activities

### Proposed current-year milestones:

- **October 00: Grid-enabled support for database distribution to secondary federations**
- **December 00: Connections to grid-based replica management for data replicated at remote sites**

**These milestones are optimistic, and are contingent upon grid project funding (e.g., PPDG).**

**Grid connections to database and other offline software development will be discussed on Friday.**
