

## GLITE VOMS SERVER AND ADMINISTRATION TOOLS (ORACLE)

### 1. RELEASE DESCRIPTION

This release contains the ORACLE version of the gLite VOMS Server and Administration Tools module v. 2.2.0. The following sections provide additional information about the release content, the module dependencies, the know bugs and issues and a list of bugs closed since the previous release. For information about installing and using the gLite VOMS Server and Administration Tools, please refer to the gLite Installation and User Guides.

### 2. CHANGES IN THIS RELEASE

#### 2.1. CHANGES IN FUNCTIONALITY

- No detailed information has been communicated about the changes in the VOMS Server functionality.
- The version of VOMS Admin is the same as in gLite 1.4
- Use new VO configuration model

#### 2.2. NEW CONFIGURATION PARAMETERS

The following new parameters have been added to the glite-voms-server.cfg.xml file:

Parameter name	Default value	Description
voms.db.oracle.instantclient.location	/usr/lib/oracle/10.1.0.3/client/	Location of the Oracle Instantclient installation. [Example: /usr/lib/oracle/10.1.0.3/client/] [Type: 'string']

All parameters used to set VO-specific values have been removed from the service configuration files and moved to a dedicated VO configuration file called vo-list.cfg.xml. A template is available in /opt/glite/etc/config/templates. This file is common to all gLite services running on this node or referenced in the same site-config file (unless locally overridden). For more information please refer to the gLite 1.5 installation guide. The VOMS instances are generated from iterating on all the VOs defined in the vo-list.cfg.xml file.

The R-GMA Service Publisher (aka R-GMA servicetool) parameters are now automatically handled by the configuration script and do not need to be explicitly set anymore in the configuration file. The parameters can be set in the configuration file to override the default values.

### 3. RELEASE CONTENTS

## 5. KNOWN BUGS AND ISSUES

This release has the following bugs and issues. Bug numbers refer to the gLite Bug Tracking system database hosted on the CERN Savannah system at <https://savannah.cern.ch/bugs/?group=jralmdw>.

### 5.1. MAIN ISSUES

- VOMS reconnects to the Oracle database for each SQL query.  
The VOMS server creates a new connection to the Oracle database for each and every SQL query. The standard practice is to use a connection pool
- VOMS Admin application update for a VO is not possible.  
voms-admin-configure doesn't allow the possibility to update parameters of a VO (e.g. the port) once the VO has been created. For the moment the only possibility is to remove a VO, change the values and create it again.
- VOMS Admin fails to boot and locks down the Tomcat instance.  
For some reason VOMS Admin 1.2.10 sometimes gets stuck in the boot process, while starting up the request scheduler. If this happens, the failed VOMS Admin instance locks down the entire Tomcat process, which is a critical issue as it prevents other services in the same process from working.
- BLOB handling is broken in VOMS Admin.
- Very bad tomcat performance affecting voms/vomrs access and gridmap file generation due to issues in VOMS Admin
