

ES-EE slopes obtained from SimHits

Fitting by other method: cut the histogram per 20 MIP and use gaussian fit. Fitting range is from (the location of peak value -1) to 1.5 RMS

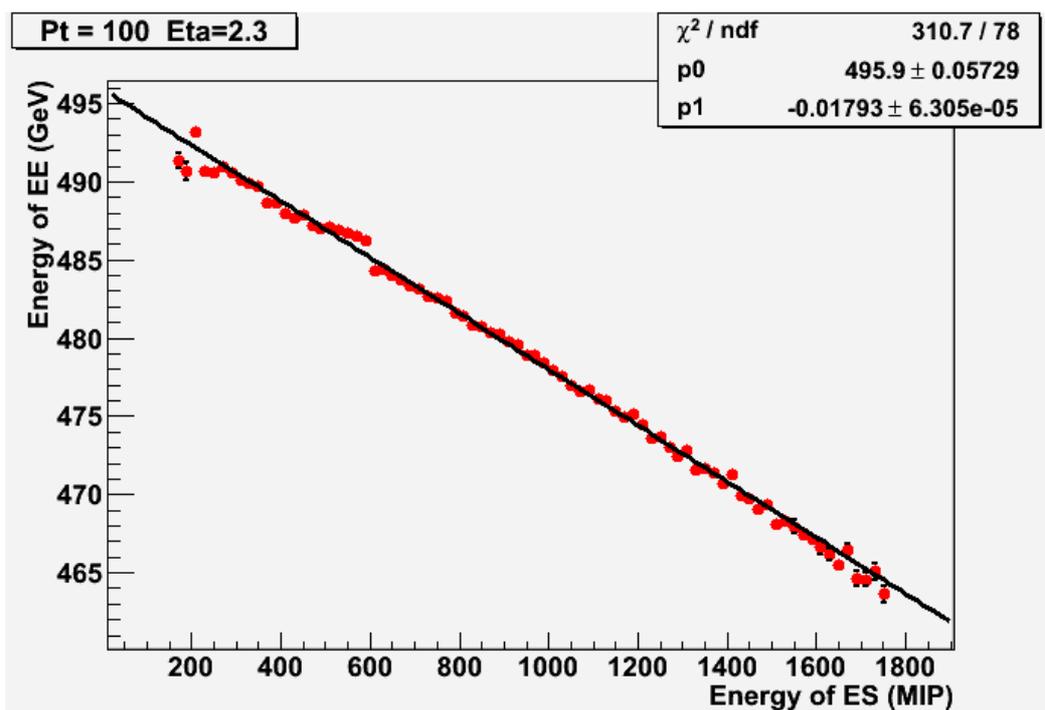

then fit the value of each bin's mean value by straight line fit to get slope.

for example:

one bin fitting:

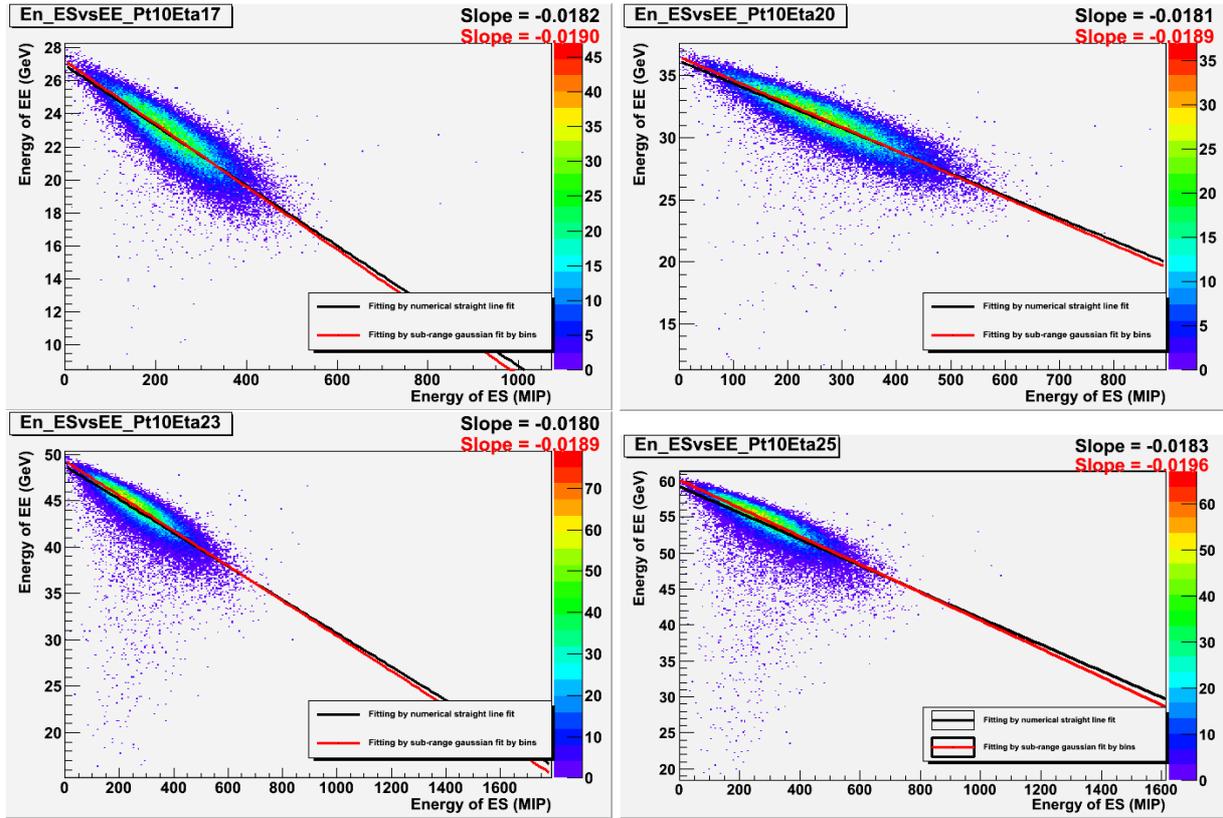

Then we get slope by getting each bin's mean value:

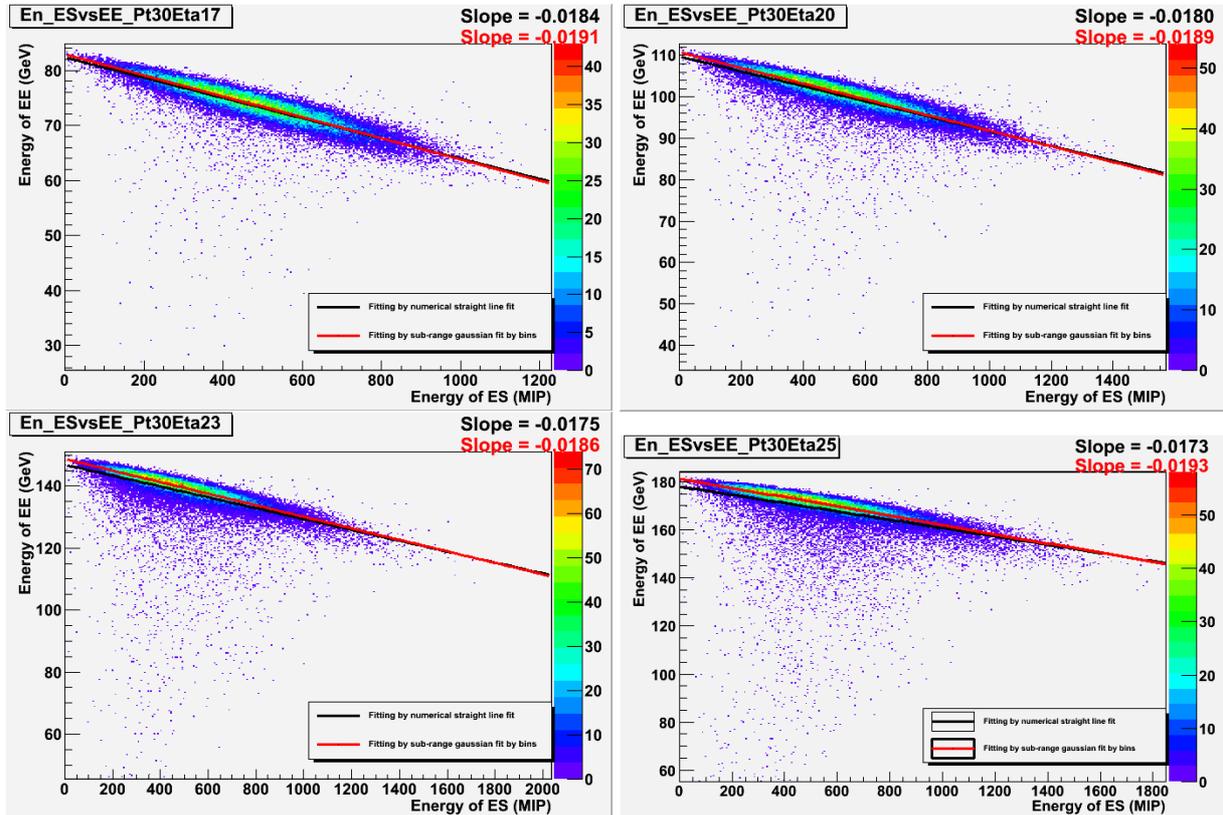

Results:

- Electron Pt = 10

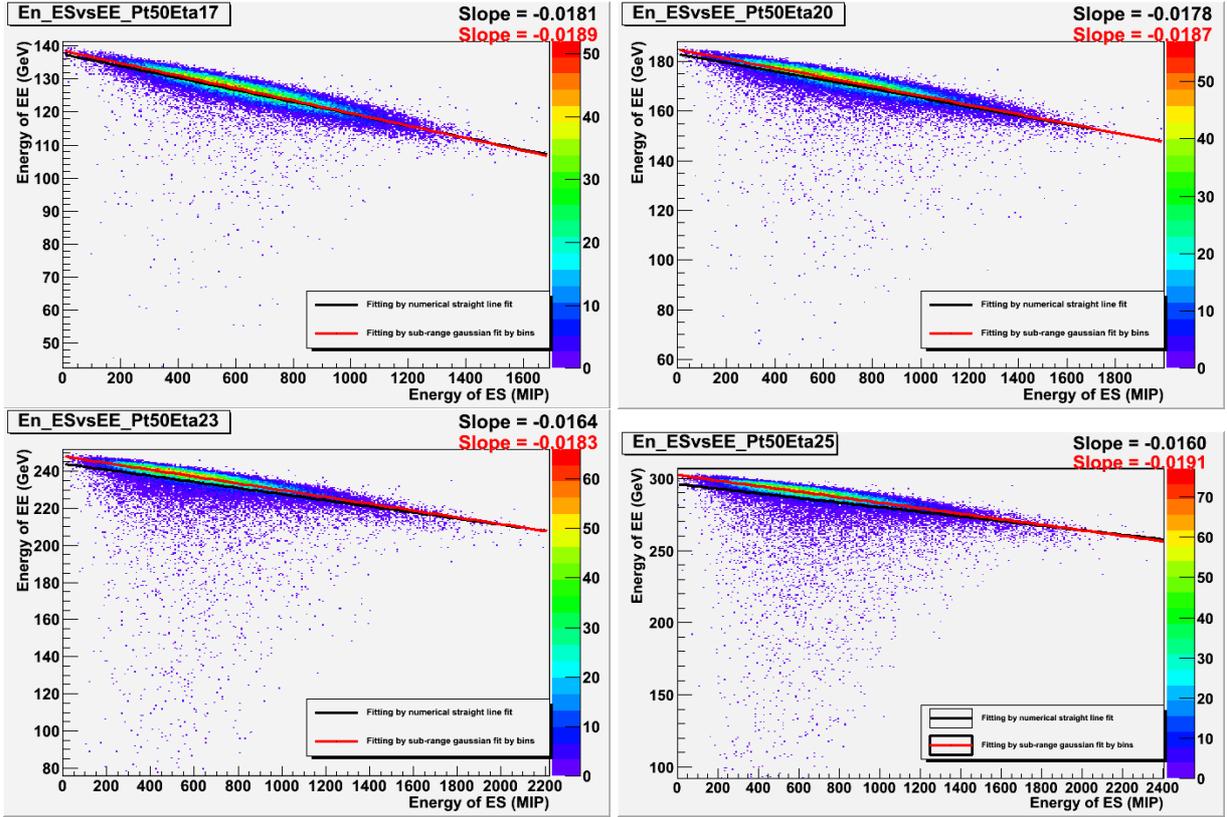

- Electron Pt = 30

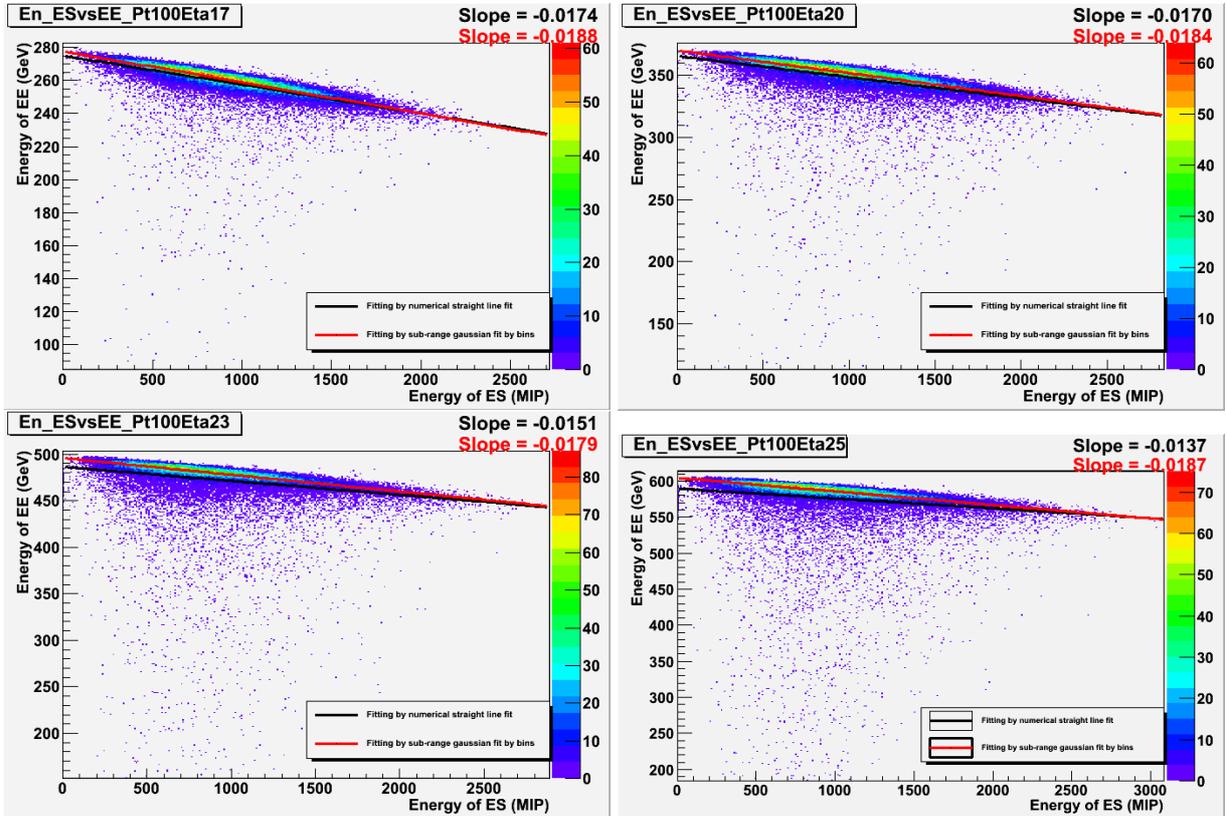

ES-EE Calibration < Main < TWiki

• Electron Pt = 50

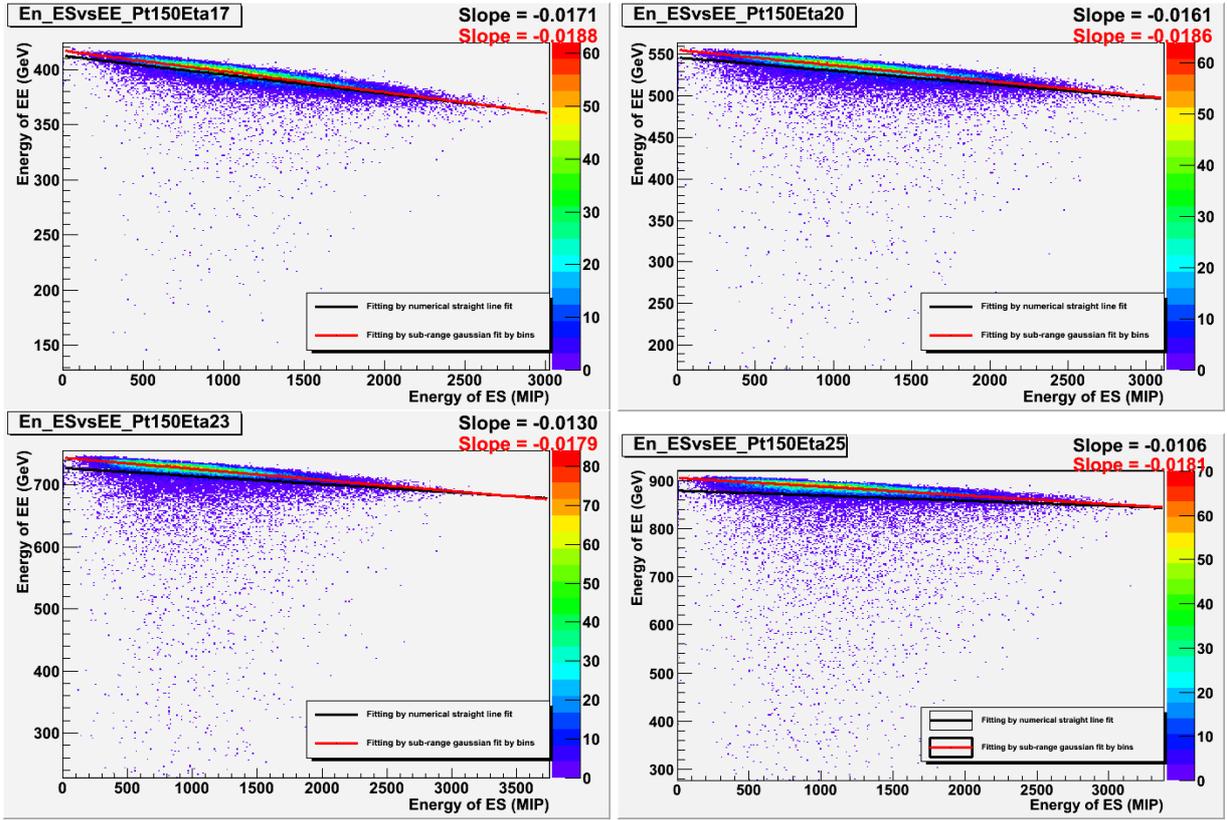

• Electron Pt = 100

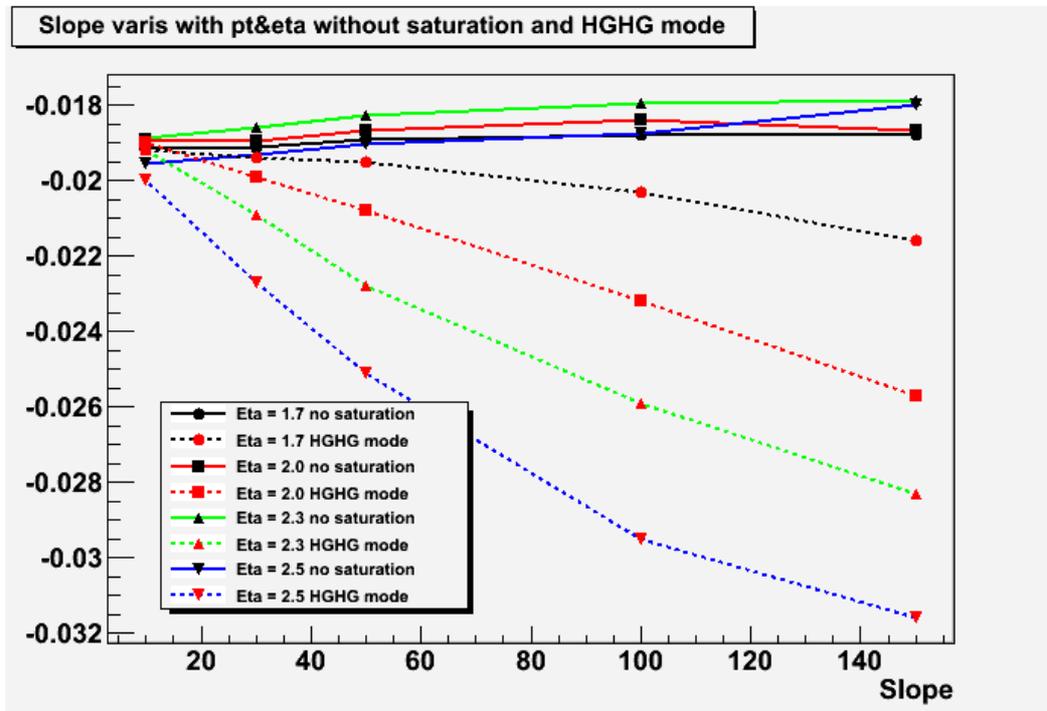

• Electron Pt = 150

Results:

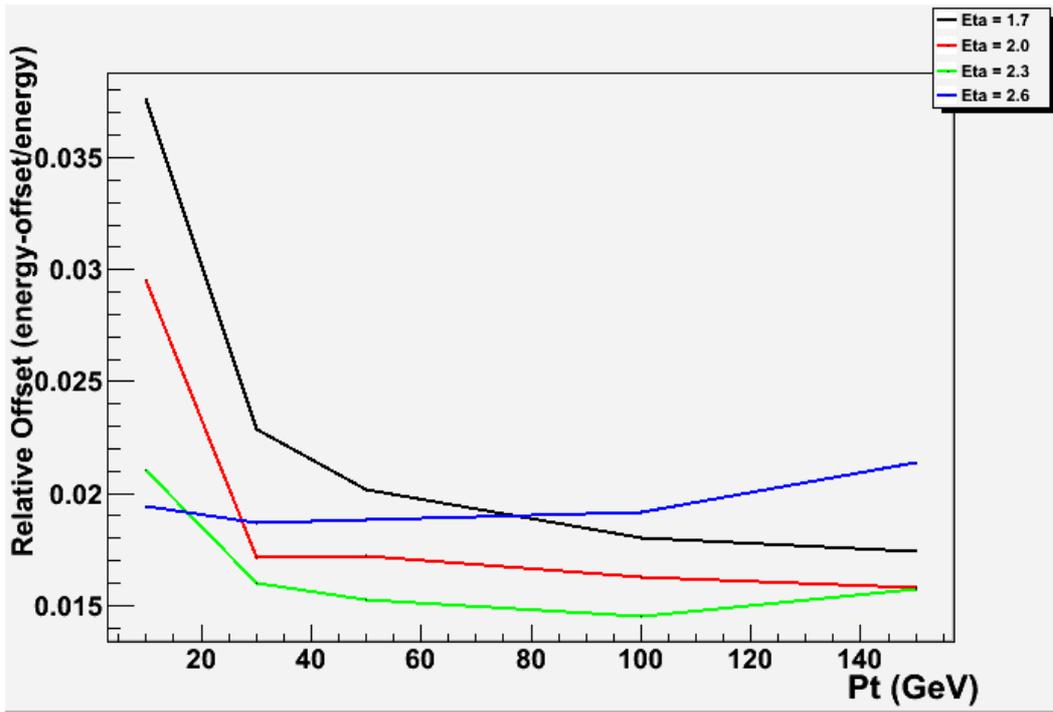

ES-EE Calibration < Main < TWiki

• Slope of Different Eta and Pt

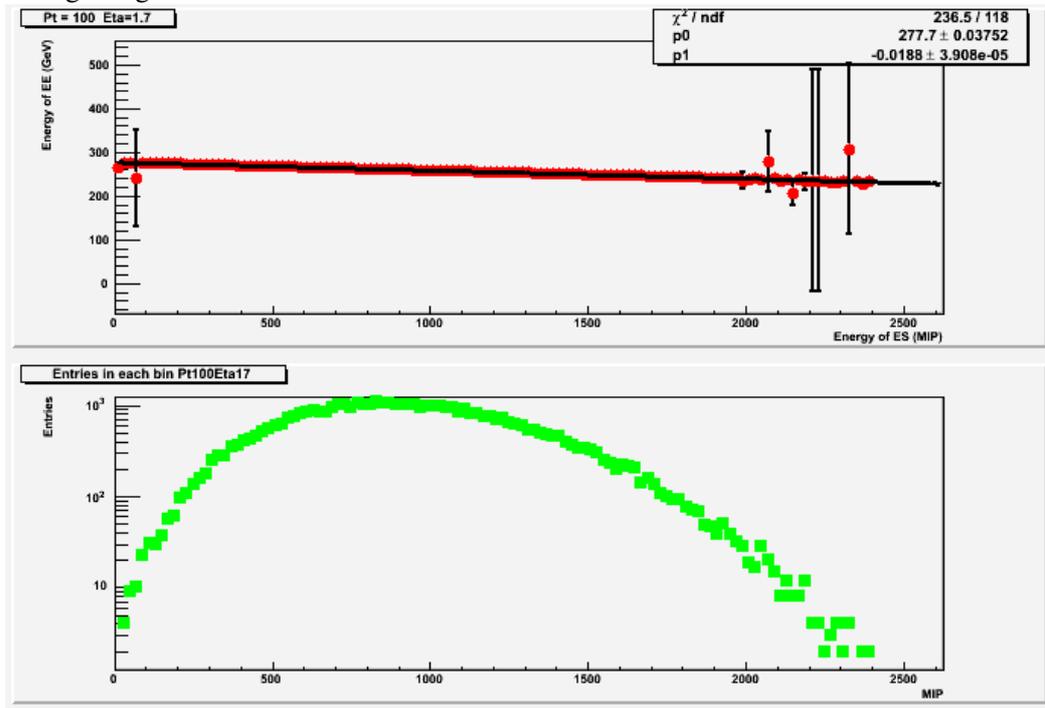

• Offset of Different Eta and Pt

- Effect of fitting range

Pt=100 Eta=1.7 (slope = p1)

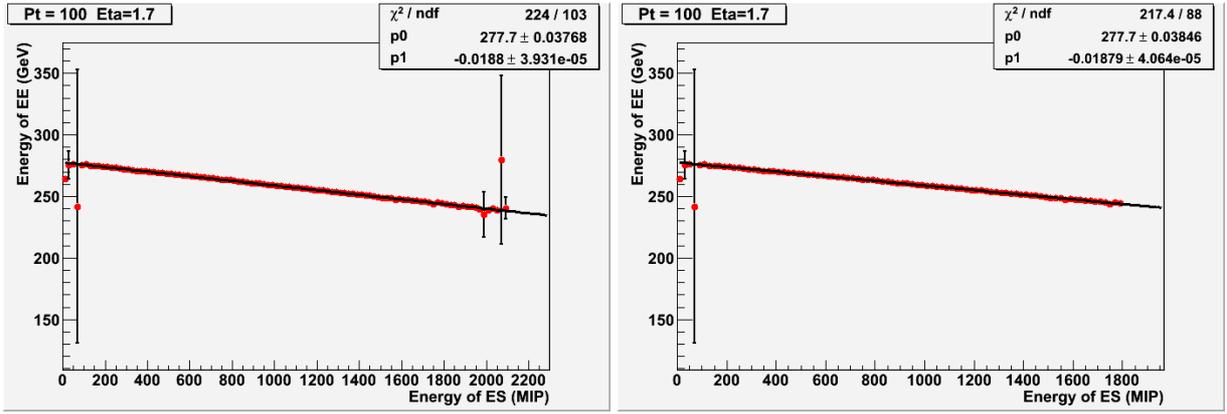

Fitting Range: 0~2400 & Entries of each bin

Fitting Range 0~2100

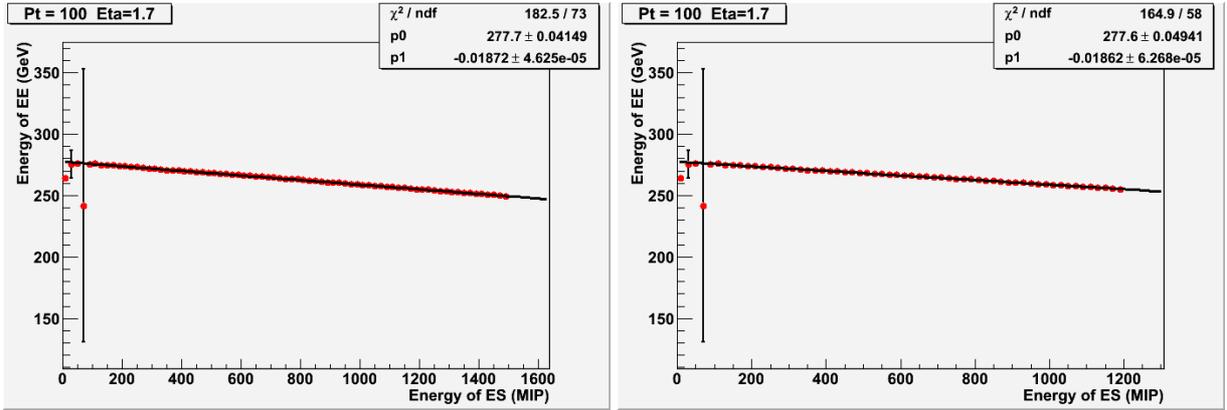

Fitting Range 0~1800

ES-EE Calibration < Main < TWiki

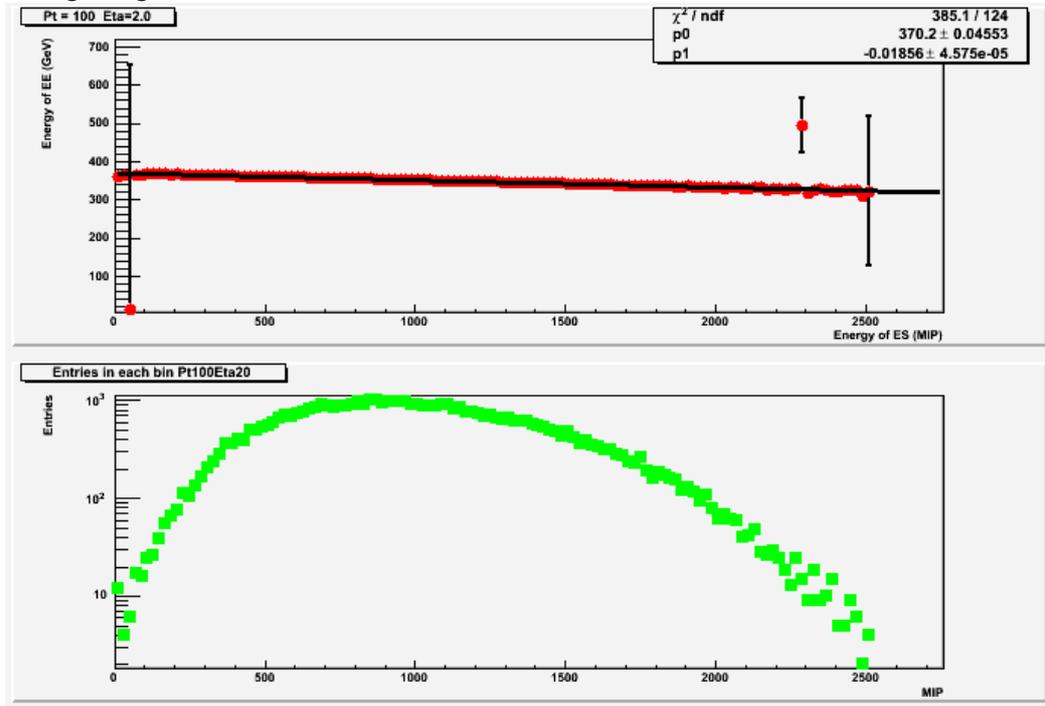

Fitting Range 0~1500

Fitting Range 0~1200

Pt=100 Eta=2.0

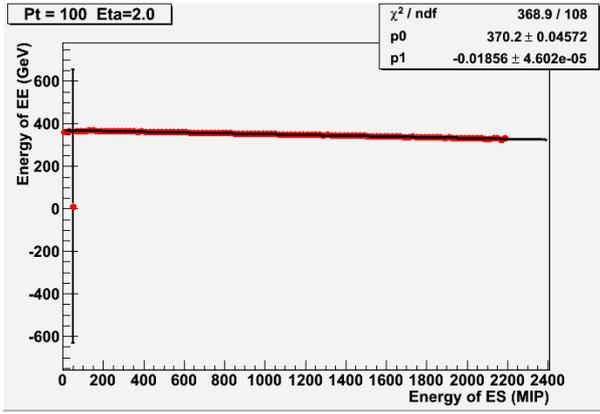

Fitting Range: 0~2520 & Entries of each bin

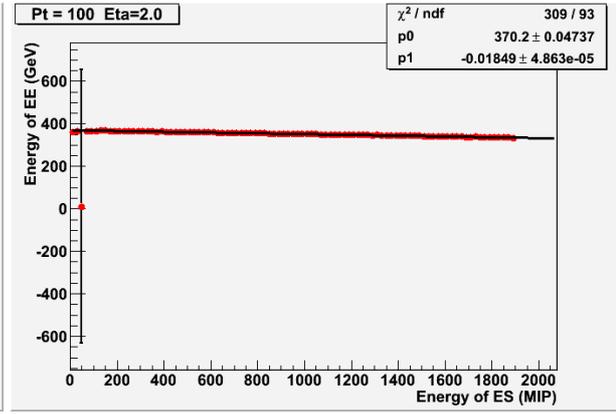

Fitting Range 0~2200

Fitting Range 0~1900

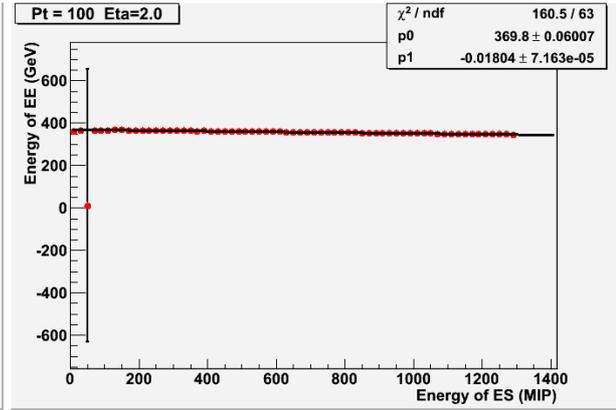

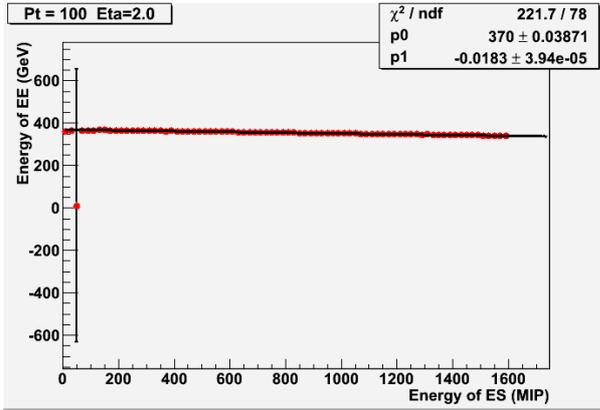

ES-EE Calibration < Main < TWiki

Fitting Range 0~1600

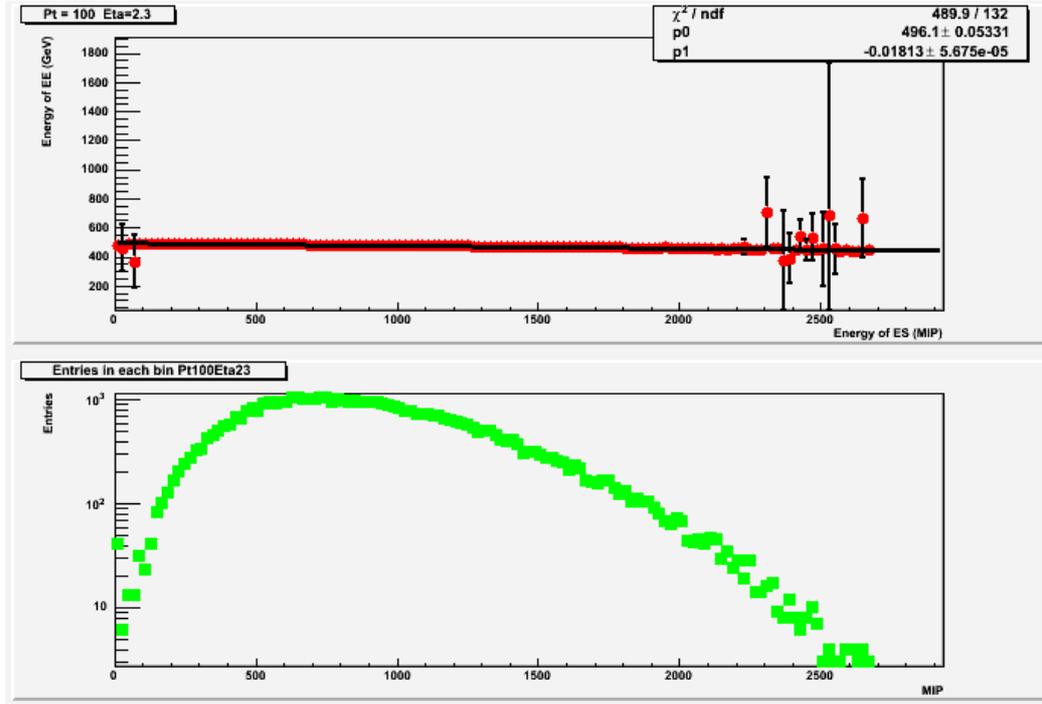

Fitting Range 0~1300

Pt=100 Eta=2.3

Fitting Range: 0~2680 & Entries of each bin

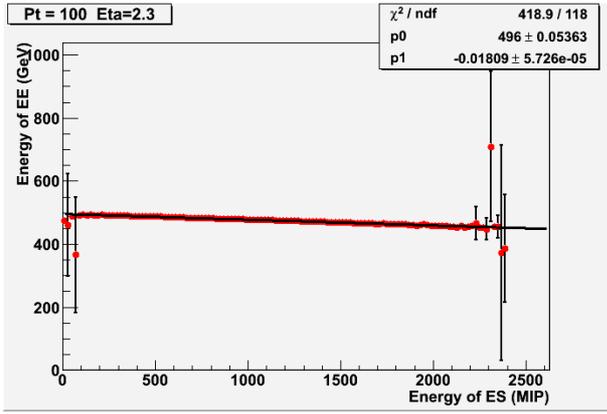

Fitting Range 0~2400

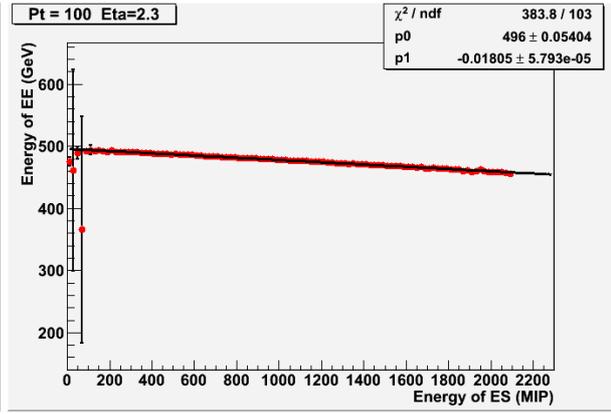

Fitting Range 0~2100

Results:

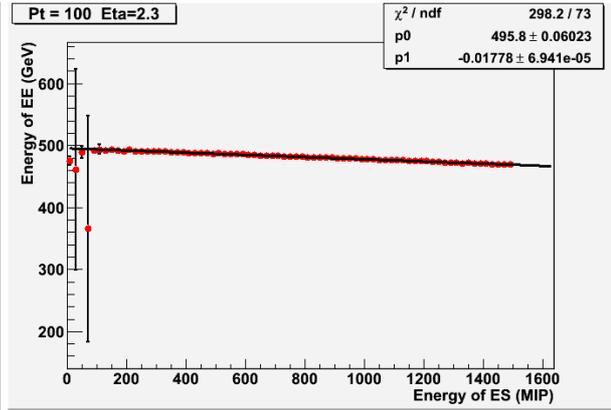

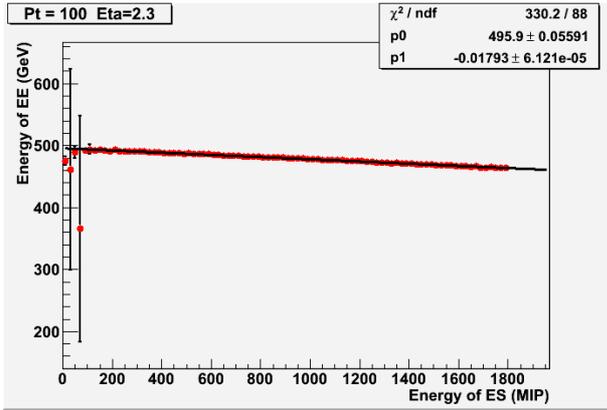

ES-EE Calibration < Main < TWiki

Fitting Range 0~1800

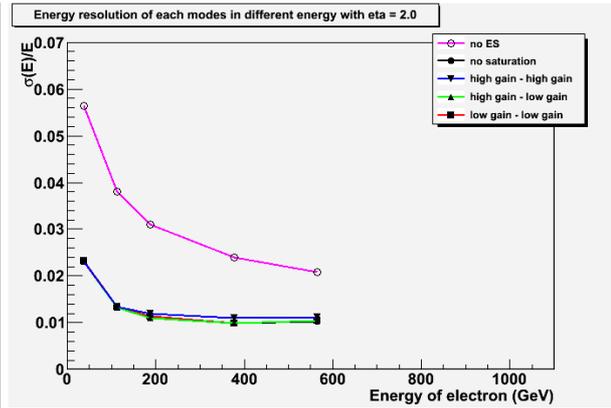

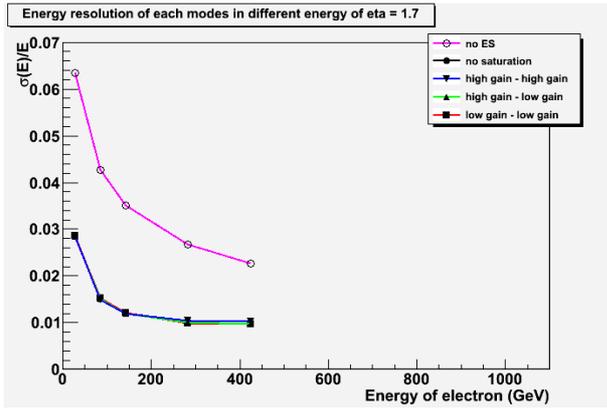

Fitting Range 0~1500

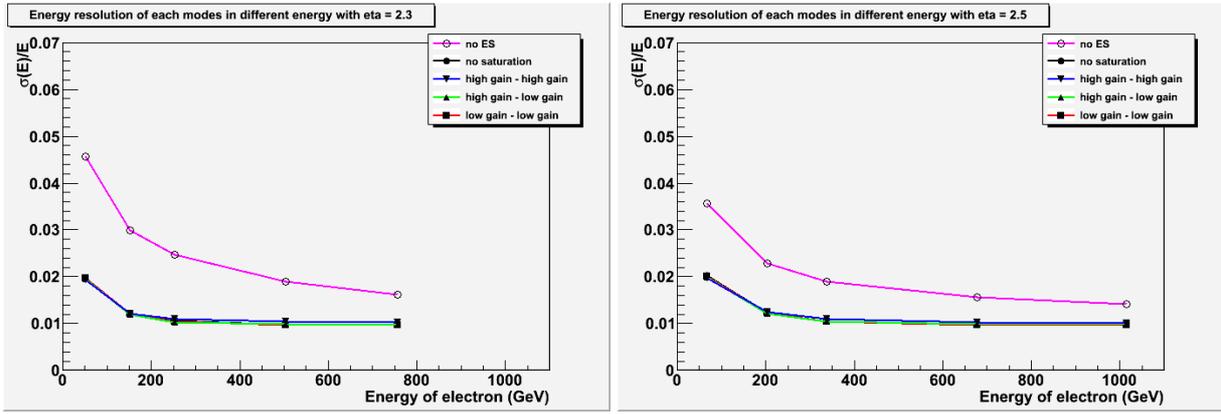

Conclusion: Effect of fitting range on slope is fine.

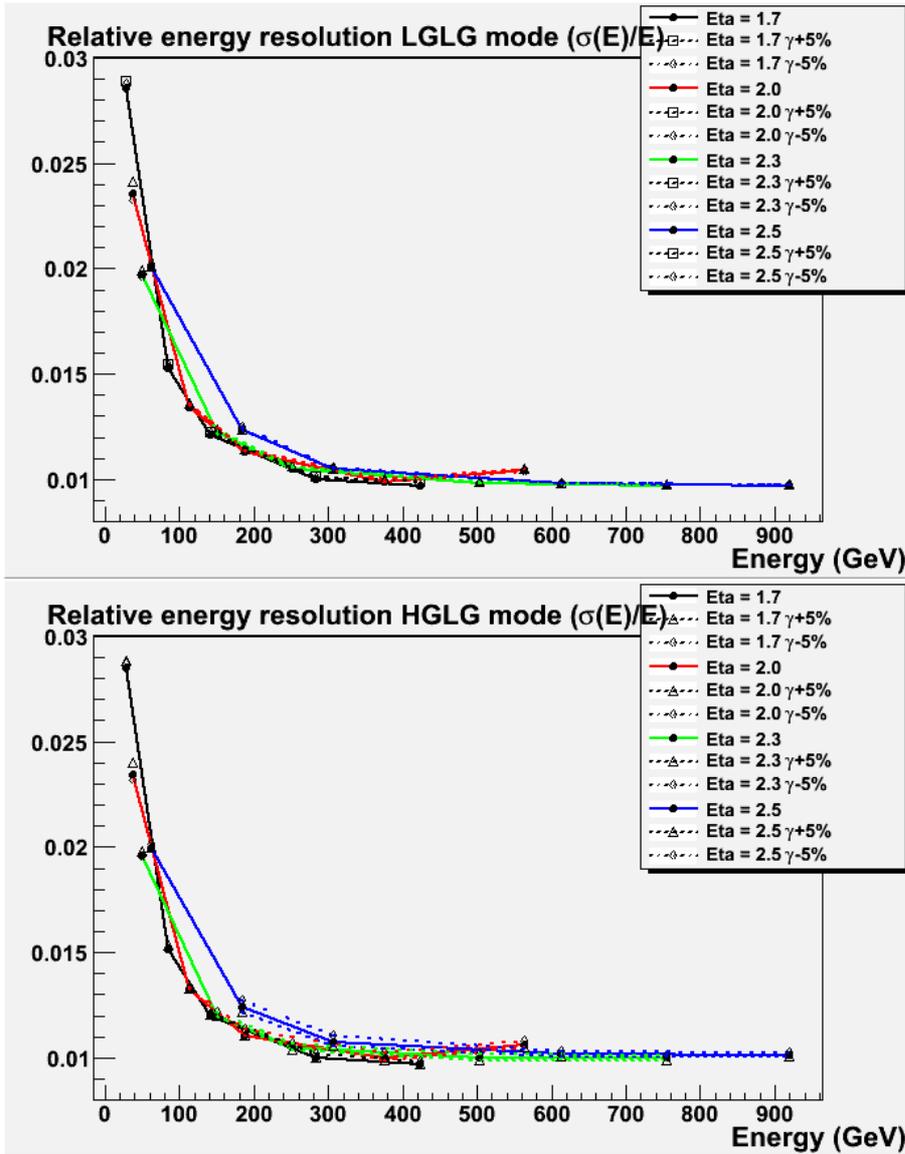

• Energy Resolution

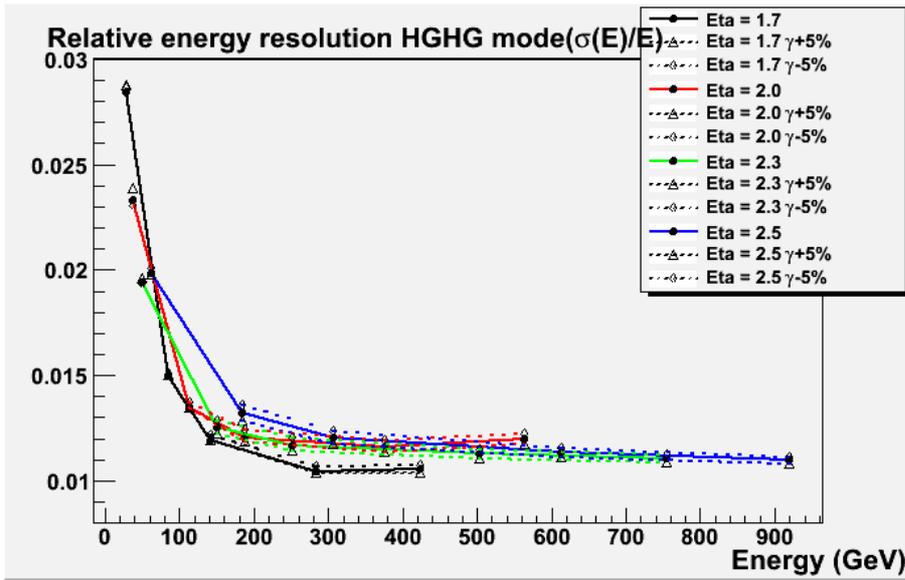

ES-EECalibration < Main < TWiki

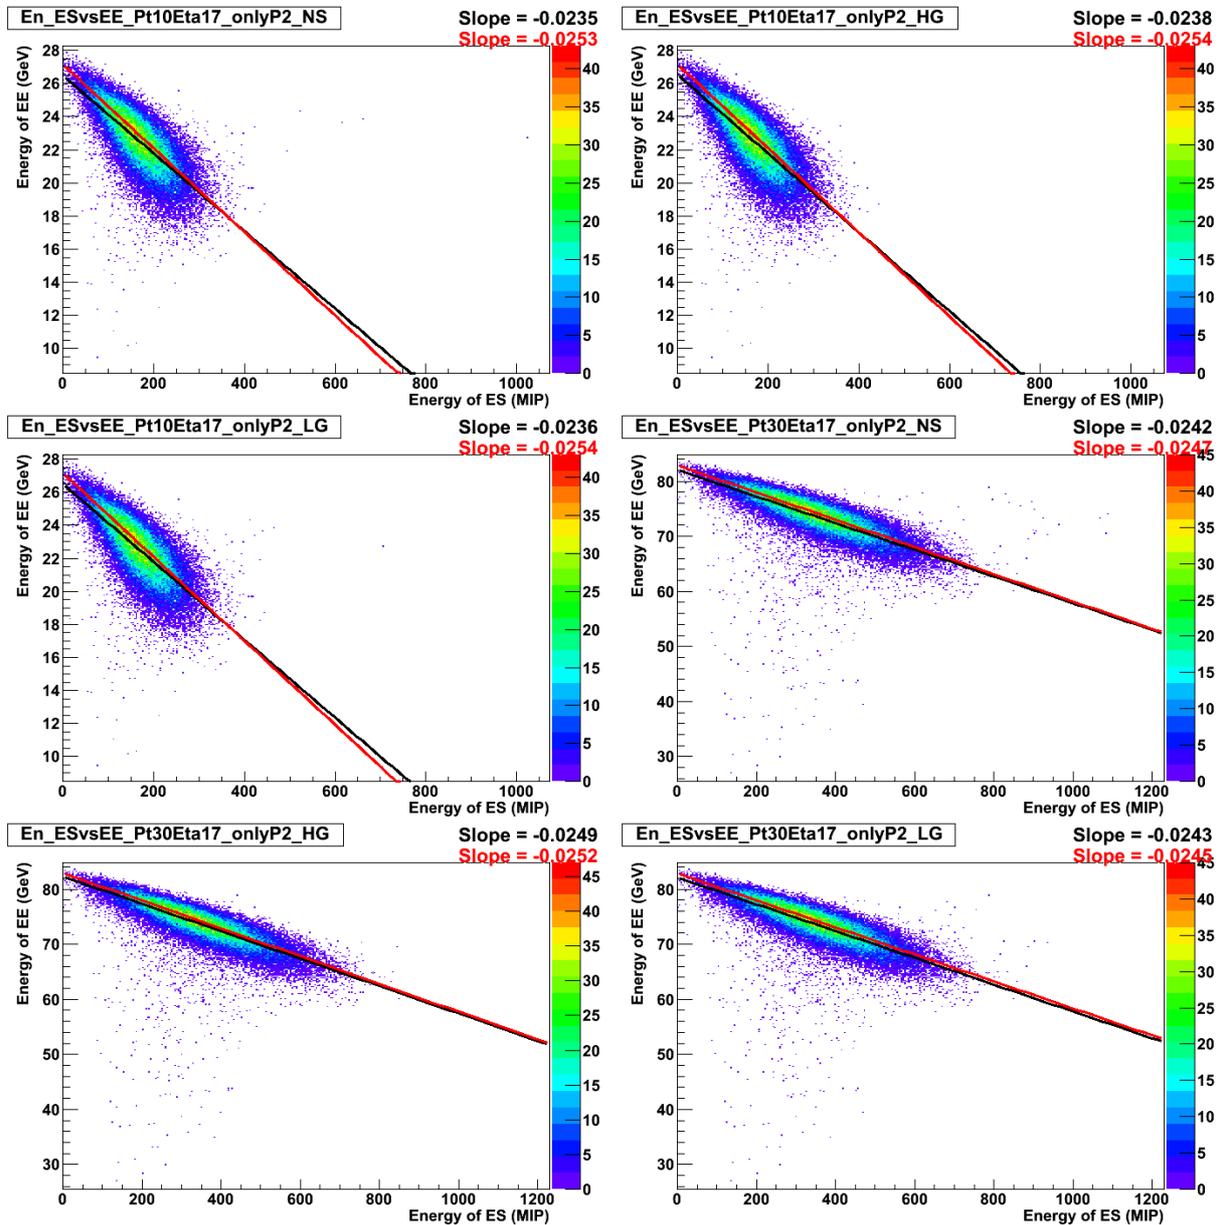

• Energy Resolution of Different Operation Modes

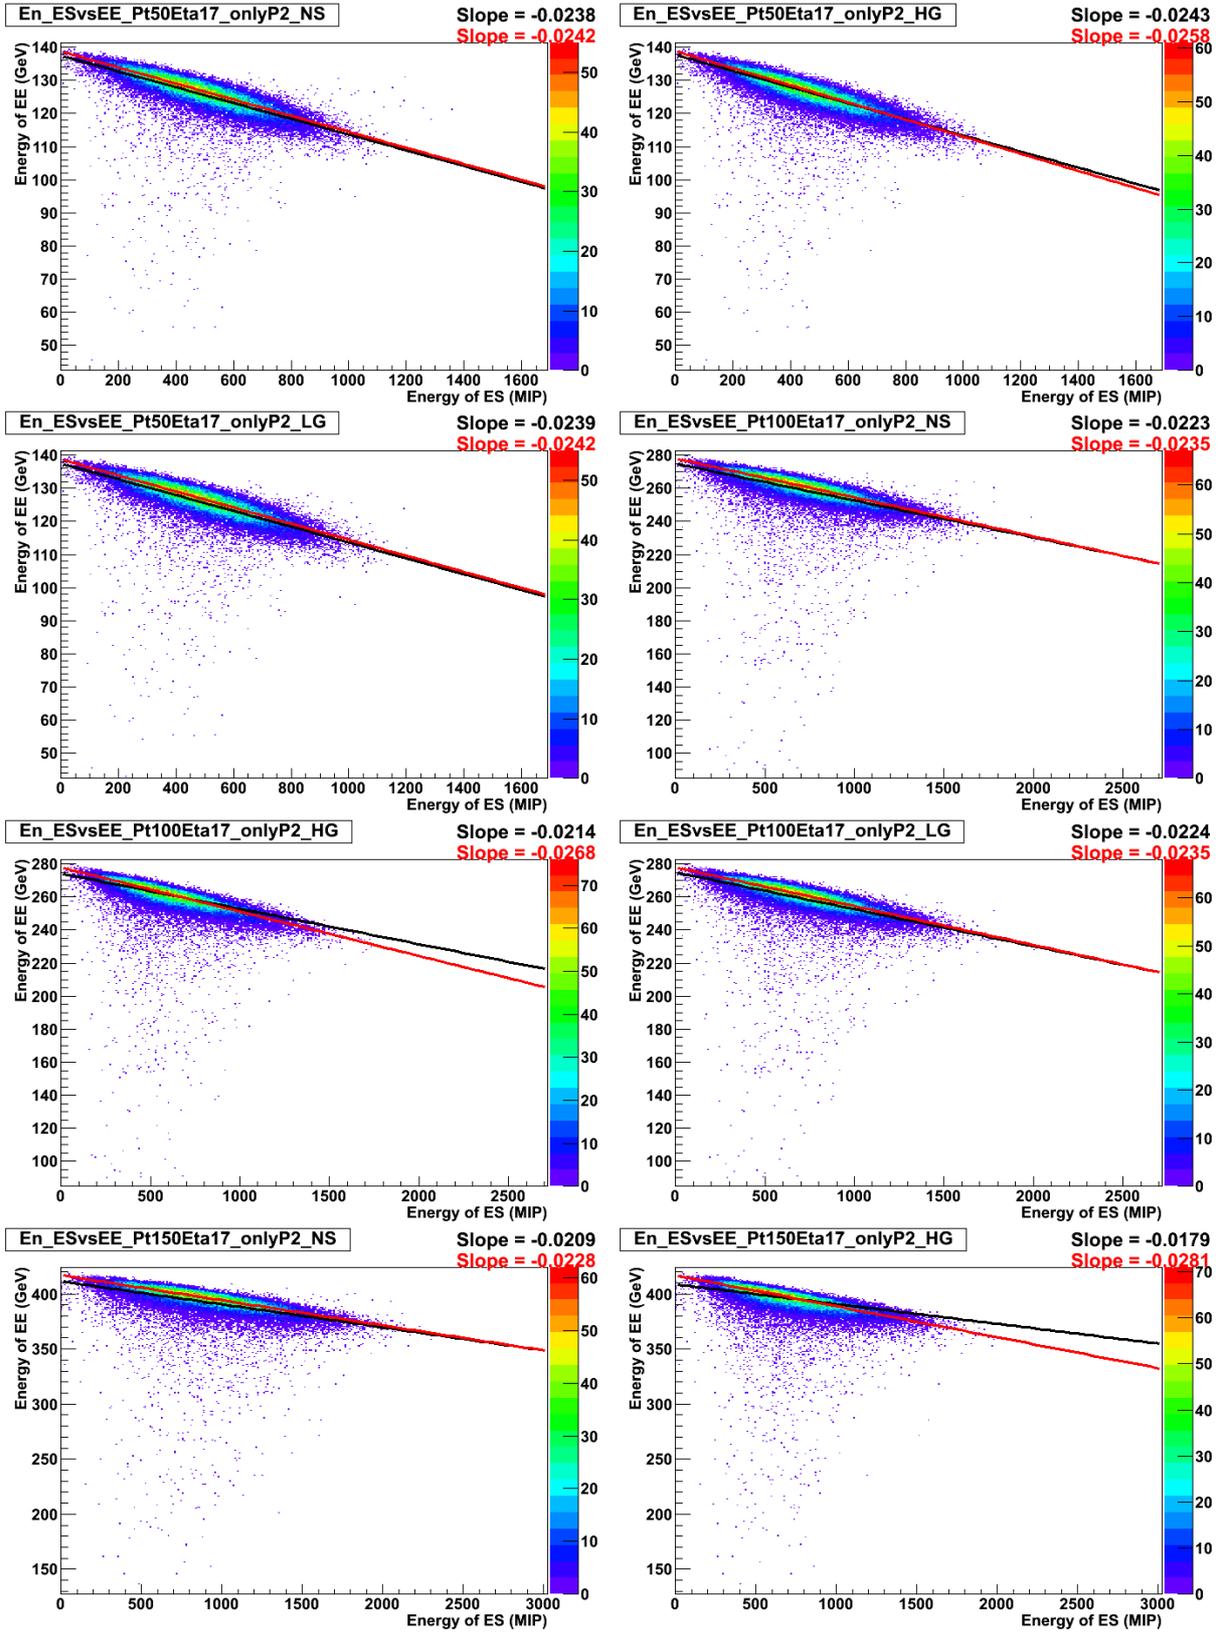

Only use 2nd ES plane to recover the energy

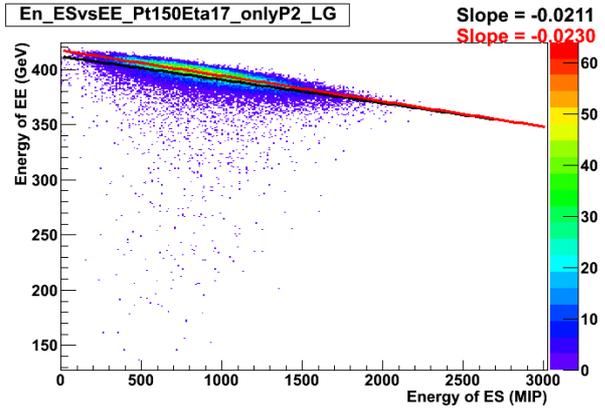

Only use 2nd ES plane to recover the energy

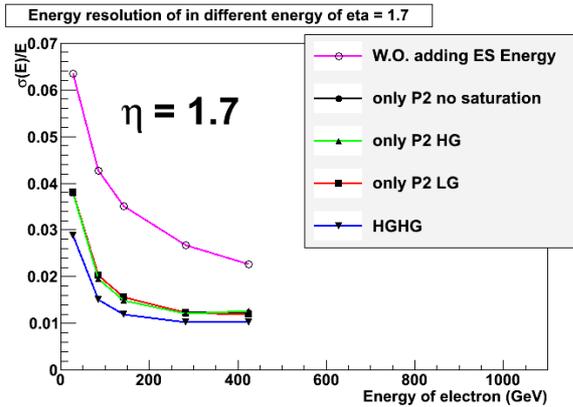

ES-EE Calibration < Main < TWiki

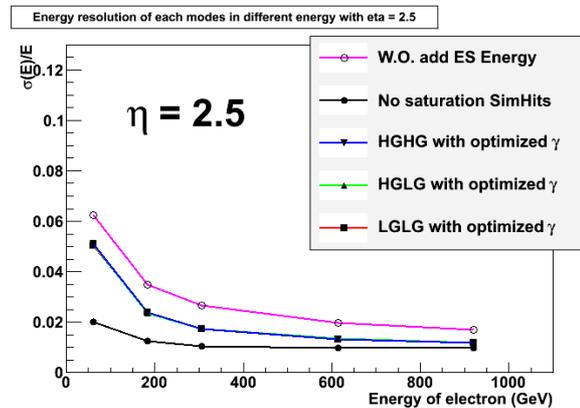

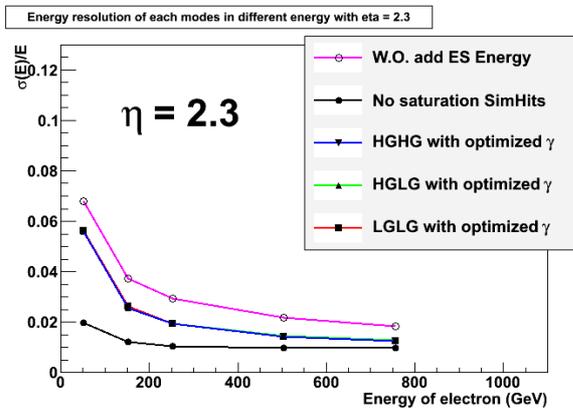

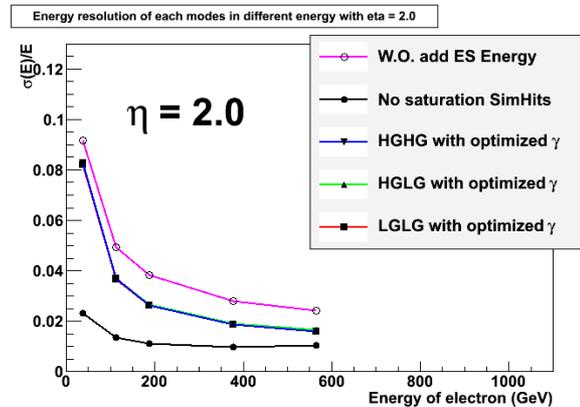

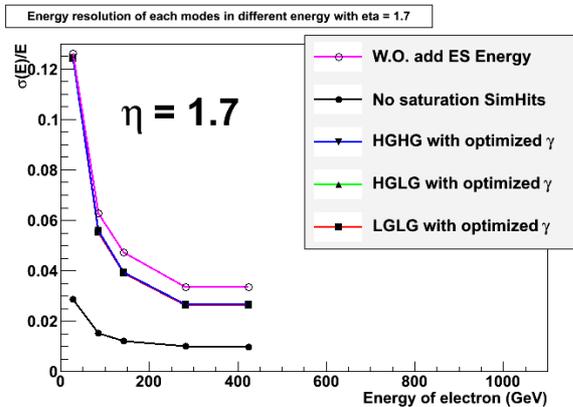

Only use 2nd ES plane to recover the energy

- Energy resolution of only 2nd plane (only add 2nd plane's energy back)

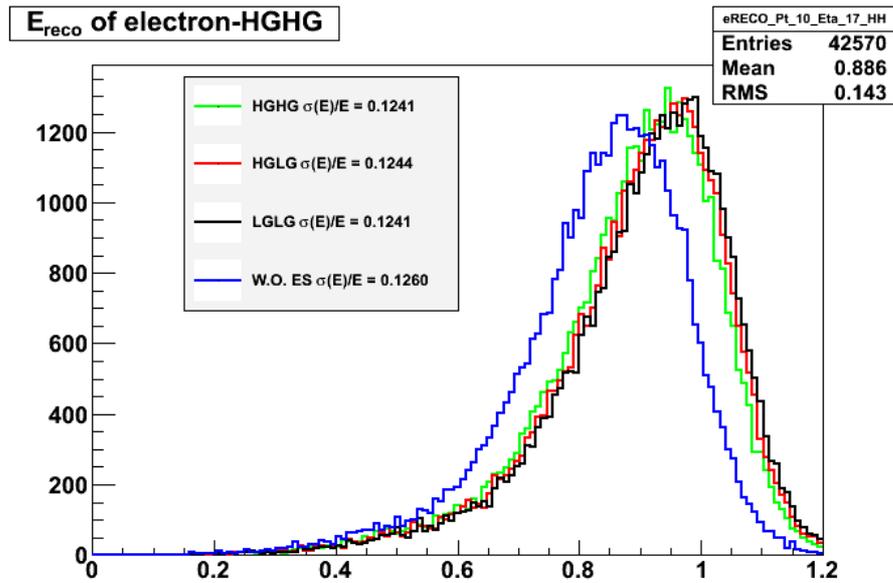

- Energy resolution of RecHits by Clustering

- Reconstructed energy spectrum using clustering

Only use 2nd ES plane to recover the energy

Pt = 10, Eta = 1.7
