31 août 2010

Abstract

"Implementation of Corrective Actions for policy violations in Oracle Enterprise Manager"

Databases are the central point of information systems and having the high availability can be crucial. The mean time to recover for an outage is defined as detection time plus repair time. Monitoring allows maintaining a very short detection time but fixing the problem can prove being time consuming as well. During the internship, I study Enterprise Manager policy violations, analyse which ones can be addressed with automatic fixes and implement these fixes for most common violations.

Chapter 1

CERN Overview

1.1 Presentation of CERN

1.1.1 History

French physicist Louis de Broglie put the first official proposal for the creation of a European laboratory at the European Cultural Conference in Lausanne in December 1949. Later, 11 countries ratify the convention establishing CERN, the European Organization for Nuclear Research thus marking the birthday of September 29, 1954. The laboratory is located on franco-swiss border on two main sites : Meyrin and Preveessin. Today CERN is the world's largest particle physics laboratory, the organization has 20 member states and 8 observers (Figure 1.1 shows the repartition on the world map). CERN is currently the workplace of approximately 2,300 staff members, as well as some 15,000 scientists, engineers and students (representing 580 universities and research facilities having 80 nationalities).

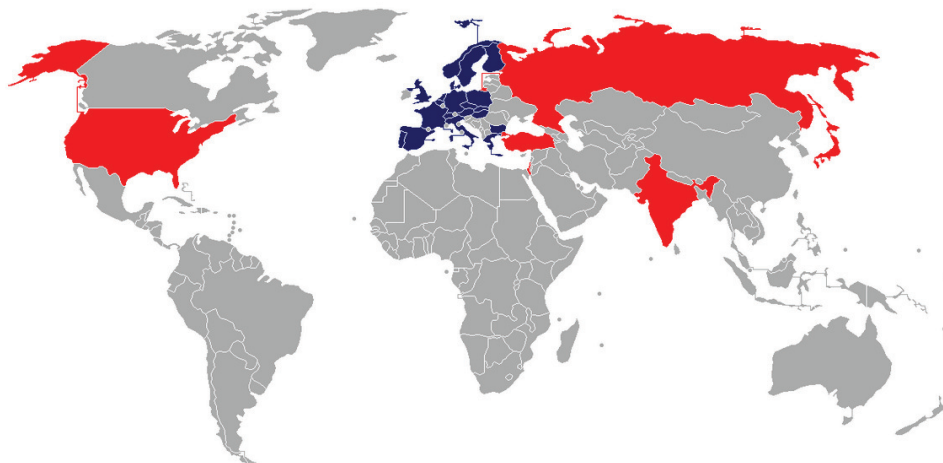

Figure 1.1: CERN members and observers

1.1.2 Computing facilities

In 1972 CERN decided to build the first computer center in Europe. Today there are 7,500 systems distributed on two floors (2650m²) which total energy consumption of more than 5MW. Following table deals with computer center facts:

Total servers	7,500
Total processing cores	50,000
Storage capacity on disk drive	19,800TB
Storage capacity on tape cartridges	24,400TB
Infrastructure servers	400
Oracle database instances	200
Oracle servers	300
Very high performance routers	150
Switches	2200
Fiber optic cables owned by CERN	5,000km
WAN connectivity	150Gbps

1.2 Organization

1.2.1 Hierarchy

Internal organization of CERN is divided in 3 hierarchical levels: departments, groups and sections. Following schema represents my place in the organization.

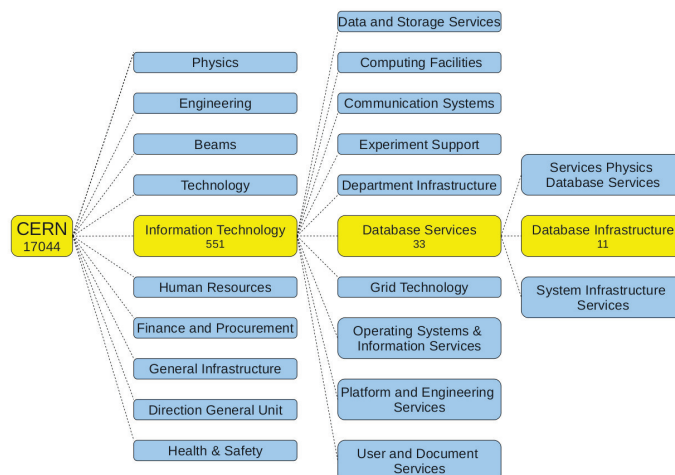

Figure 1.2: hierarchy at CERN

1.2.2 Collaboration

CERN is engaged in many international initiatives. In computing, CERN has three major projects:

- **Enabling Grids for E-science (EGEE)** : European grid for scientific research.
- **Worldwide LHC Computing Grid (WLCG)** : Grid based on EGEE and OSG (Open Science Grid) for analyses of data from the LHC. It's a grid which aggregates computing power from all around the world.

Following figure shows the service hierarchy in WLCG:

Figure 1.3: WLCG infrastructure

In this collaboration, each tier has predefined tasks:

- tier-0 : CERN
 - * Data recording
 - * Initial data reconstruction
 - * Data distribution
 - tier-1 : 11 centres
 - * Permanent storage
 - * Re-processing
 - * Analysis
 - tier-2 : 200 centres (2010)
 - * Simulation
 - * End-user analysis
- **Openlab project** : Collaboration between CERN and leading industry actors (Oracle, HP, Intel and Siemens). Projects are based on the needs of each partner, taking into

account CERN specific needs in the area. For example, Oracle is providing alpha and beta releases of their software for testing. This way Oracle can validate its applications from big real environment while CERN readiness for future Oracle releases.

1.3 Major innovations in information technologies

Although CERN is a physic research laboratory, sometimes major innovations in other domains appear:

- **The World Wide Web:** At the end of 80's, scientists around the world needed to share their work. To facilitate this, in 1989 Tim Berners-Lee invented a global information system known as the **World Wide Web (www)**.
- **The Grid:** Computing grid is similar to electric power grid, with main purpose to share computing resources all over the world in order to increase overall computing performance.

Chapter 2

Theoretical concepts and statistics on policy violations

For all activities like physics experiments or human resources management, CERN needs many databases (Schema in annex 1 shows the complex structure of CERN database systems). All RDBMS¹ software is supplied by Oracle, and is monitored by Oracle Enterprise Manager Grid Control. Monitoring is required in big infrastructure in order to react quickly to problems or misconfigurations. This part of the report focuses on theoretical concept used in the implementation of corrective actions and the actual state of the policy violations in CERN databases (statistics and their evolution).

2.1 Theoretical concepts

2.1.1 Definitions

- **Target:** in Enterprise Manager, a monitored object is called target. The target are of different types: databases, hosts, agents, etc. . .
- **Policy:** policies define how you want your systems to behave, in order to remain in compliance with organization security, configuration, and storage standards.
- **Policy violation:** abnormal state when system is not compliant with a policy.
- **Corrective action:** Automatic response to a target alerts or policy violations.
- **Monitoring template:** Set of metrics and policies.
- **Management repository:** database which contains all the information relative to Enterprise Manager.

¹Relational Database Management System

- **Notification rules:** set of conditions that determine when a notification occurs.

2.1.2 Monitoring templates

In order to organize all metrics and policies in Enterprise Manager, **monitoring templates** are used. They allow to group together a set of metrics and policies with common purpose. In Enterprise Manager, the section *Setup->Monitoring templates* displays all monitoring templates. However it is not easy to find targets and groups of targets this templates are applied to. Generally, correlation between monitoring templates and targets is visible in *policy associations* page. But using repository views, it is more straightforward to find all informations about monitoring templates.

The two most interesting views are:

- **MGMT\$TEMPLATES:** Displays details of all the management templates stored in the Management Repository.
- **MGMT\$TEMPLATE_POLICY_SETTINGS:** Displays policy settings for management templates.

Annex 2 shows monitoring templates used for each policy.

2.1.3 Policy check : Internal mechanism in Oracle Enterprise Manager

In initial state, there are no alerts or policy violations in Enterprise Manager because metrics/policies and targets aren't bind together. To link policies and targets, it is necessary to apply a monitoring template on target or group of targets. Following schema shows the relation between policies, monitoring templates and target groups.

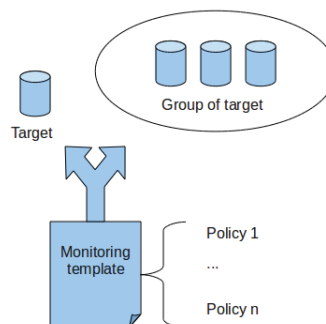

Figure 2.1: Relation between monitoring templates and targets

2.2 Analysis on policy violations

The main page of Enterprise Manager displays a summary of all alerts and policy violations. We can see on next figure a myriad of alerts and policy violations in the existing system (more than 15,000 policy violations and about 800 for the last 24 hours). Policy violations cover all types of targets.

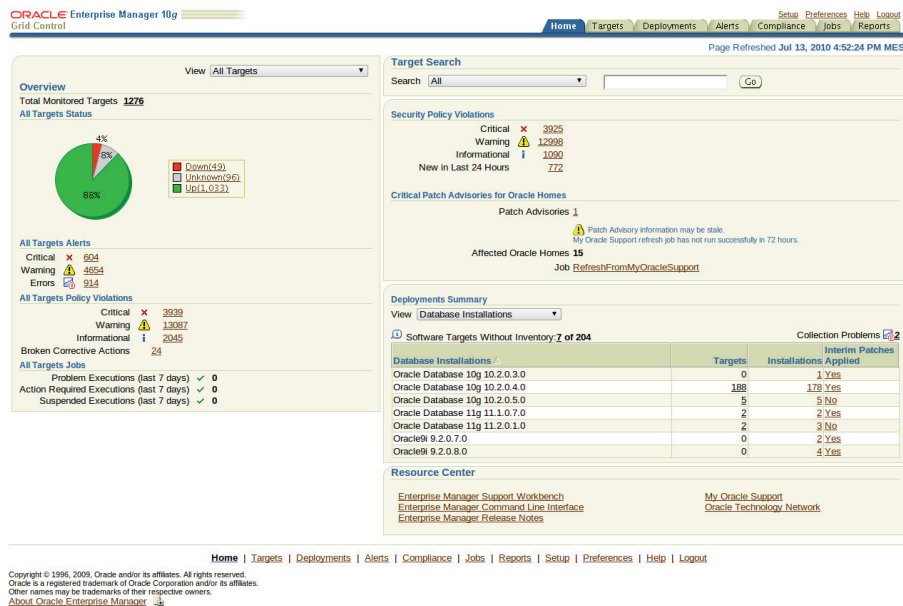

Figure 2.2: Oracle Enterprise Manager Grid Control main page

2.2.1 Evolution of number of alerts

Since policies were implemented at CERN in 2007, quantity of policy violations is continuously increasing and currently approximates at 25 000 violations per year. It is important to analyse this violations and see which of them can be fixed with automated responses thus decreasing their total number.

Figure 2.3: Explosion of policy violations

2.2. Analysis on policy violations

2.2.2 Statistics on policy violations

In Enterprise Manager, we can only see information about current policy violations. We can see on next figure the policy violations page in Enterprise Manager:

Severity	Violation Count	Policy	Target	Type	Most Recent Violation	Category	Compliance Score (%)
Warning	24	Oracle Home File Permission		Database Instance	Jul 14, 2010 12:43:07 PM CEST	Security	76 Sep 7, 2009 12:20:22 PM CEST

Figure 2.4: Policy violations: page in Enterprise Manager

To create statistics on policy violations, we need to query historical views which are stored in Enterprise Manager repository. The two interesting views in the repository for this task are:

- `MGMT$POLICY_VIOLATIONS_CURRENT` : same informations as Enterprise Manager pages
- `MGMT$POLICY_VIOLATIONS_HISTORY` : all history of policy violations

Following image displays the content of `MGMT$POLICY_VIOLATIONS_CURRENT`:

TARGET_NAME	TARGET_T...	TYPE_DISP...	TARGET_GUID	POLICY_NAME	POLICY_GUID	CATEGORY

Figure 2.5: Policy violations: contents of `MGMT$POLICY_VIOLATIONS_CURRENT`

In order to detect the most common violations, we can classify them by target type (database, listener, host etc. . .) or by category (security, configuration, storage).

Violations by target type

Violation target type	total	ratio
Database Instance	10447	55.47%
Cluster Database	5944	31.56%
Listener	1655	8.79%
Host	744	3.95%
other (ASM, OC4J, HTTP, Weblogic)	45	0.24%

Figure 2.6: Policy violations by target type (table)

Figure 2.7: Policy violations by target type (chart)

Violations by category

Violation category	total	ratio
Security	17765	94.18%
Configuration	584	3.10%
Storage	513	2.72%

Figure 2.8: Policy violations by category (table)

Figure 2.9: Policy violations by category (chart)

2.2. Analysis on policy violations

By analysing these tables and charts, it is very easy to identify the problem. Most of the violations are on databases (clusters or single instances) and are security related.

Let's see the top 15 policy violations for the last month. Following query results show the number of violations per policy for the last 30 days:

```
1 SELECT policy_name, count(*) AS tot FROM
2 (
3     SELECT * FROM MGMT$POLICY_VIOLATION_CURRENT
4     WHERE collection_timestamp > (sysdate - 30)
5 )
6 GROUP BY policy_name
7 ORDER BY tot desc
```

Policy name	Enterprise manager name	total
Select_Privilege	Access to DBA_* Views	906
Select_Any_Table	Granting SELECT ANY TABLE privilege	351
Oracle_Home_File_Permission	Oracle Home File Permission	253
Unlimited_Table_Space_Quota	Unlimited Tablespace Quota	177
Open_ports	Open Ports	77
Password_Life_Time	Password Life Time	31
Password_Grace_Time	Password Grace Time	26
HIDDEN_PARAMS2	Use of Non-Standard Initialization Parameters	23
SYSTEM_AS_DEFAULT_TBSP	Non-System Users with System Tablespace as Default Tablespace	19
Password_Locking_Time	Password Locking Time	18
EXECUTE_UTL_FILE_Privileges_To_PUBLIC	Execute Privileges on UTL_FILE To PUBLIC	12
Password_Complexity_Fn_Usage	Password Complexity Verification Function Usage	12
Oracle_Home_Executable_Files_Owner	Oracle Home Executable Files Owner	12
Sql92_Security	Use of SQL92 Security Features	12
initora_File_Permission	Initialization Parameter File Permission	10

Figure 2.10: Most common violation

We can see that few policies are responsible for the biggest slice of the violations. These violations we will try to solve by using corrective actions.

Chapter 3

Implementation and test of corrective actions

In this part, we will see what is a corrective action and how to test it by simulating policy violation. There are many types of policy violations corresponding to different target types (example: host related policy violation). This document addresses only databases related policy violations.

3.1 Corrective actions : theory and internal mechanism

3.1.1 Corrective actions : Why?

The MTTR¹ for an outage is defined as the detection time plus the repair time. Grid Control allows us to decrease detection time by monitoring targets with policies and metrics. It is possible to decrease the repair time by implementing automated responses to abnormal behaviour called **corrective actions**. Reducing the overall MTTR can be crucial for meeting service level agreements.

3.1.2 Policy violation and corrective action process

In a production system, an abnormal behaviour can trigger a policy violation if the policy is applied to corresponding target using monitoring template. Enterprise Manager allows the definition of corrective actions in response to this policy violation. If the corrective action succeeds, system returns in a normal state. But if failed, system will stay in an abnormal state

¹Mean Time To Recovery

until there manual solution is applied, because corrective action is triggered only the first time the policy is violated or severity state changes.

Figure 3.1: policy violation and corrective action process

3.2 Corrective actions set up

3.2.1 Corrective actions constraints

There are three major constraints with corrective actions:

1. Corrective actions will be applied only in response to new policy violations.
2. "A corrective action is added to a target metric only if it is defined in the monitoring template when that template is **first** applied"²

The only way to implement corrective actions on existing monitoring templates is the following procedure:

- "Create like" new template from existing monitoring template
 - Edit the new template
 - Drop the old one
 - Apply the new one
3. Enterprise Manager needs database credentials (Normal and SYSDBA when we want execute query with system privileges like *REVOKE*) and host credentials of the database server. These credentials are required to execute our query through textitsqlplus. If there are 10 databases, credentials must be set for each of them. Figure 3.2 shows the preferred credentials page.

²Oracle Enterprise Manager 10g : Grig Control Implementation Guide

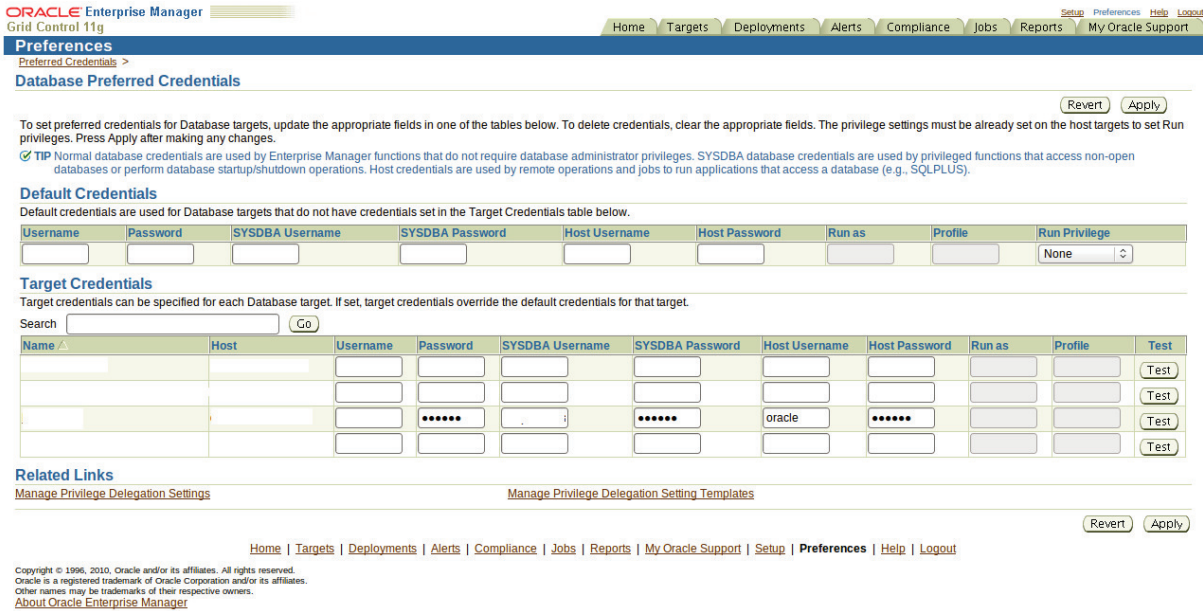

Figure 3.2: Preferred credentials page

3.2.2 Corrective actions set up

In this part, we will explain step by step the set up of a corrective action:

1. Definition of a monitoring template. In Enterprise Manager, the page *Setup->Monitoring templates* allows creation of new templates. Figure 3.3 shows the page with all monitoring templates.

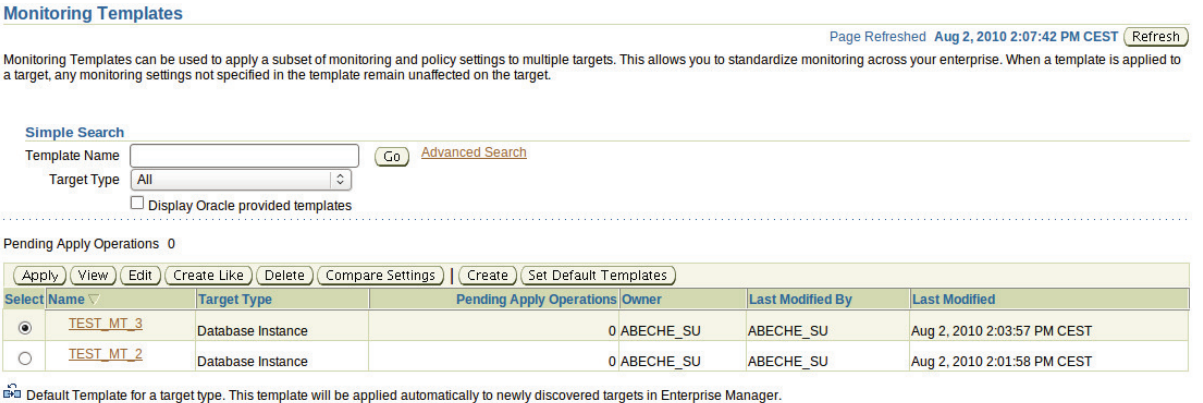

Figure 3.3: Monitoring templates page

2. Common parameters like name and description need to be filled together with dedicated metrics and policies during the creation of monitoring template. Figure 3.4 shows the page where we can assign policies to a monitoring template.

3.2. Corrective actions set up

General Metric_Thresholds Policies Access							
This table allows you to add and customize policies associated with this template.

Figure 3.4: Policies assignment to a template

- For each defined policy, it is possible to attach a corrective action and prevent multiple execution of it as shown in the figure 3.5

Corrective Action

In case of violation, the corrective action, if specified, is automatically executed.

Corrective Action **CA_ALL_SOURCE**

- Prevent multiple executions of this corrective action from running simultaneously for the same violation.

Figure 3.5: definition of new corrective action for a policy

- During the creation of corrective action, you can choose the type of response (*SQL script*, *host script*, ...). For example, following figure 3.6 shows the page where a script can be written and displays all parameters available for its use.

General Parameters Credentials																																																	
<p>* SQL Script</p> <div style="border: 1px solid black; padding: 5px;"> <pre>REVOKE %context_value_privilege% ON ALL_SOURCE FROM %context_value_grantee%;</pre> </div> <p>Parameters</p> <div style="border: 1px solid black; padding: 5px;"> <p>Enter SQL or a fully qualified script name on the remote host, for example, "@script".</p> <p>Enter optional parameters to SQL*Plus.</p> </div>	<p>Target Properties</p> <p>Target properties can be used in parameters Property names are case-sensitive. Figure 3.6: corrective action : scripting page

- In the last step we apply monitoring template to a target or a group of targets

3.3. Simulation : Policy violation + corrective action

Apply Monitoring Template TEST_MT_3: General

Source Template TEST_MT_3
Target Type Database Instance
Owner ABECHE_SU

Apply Options

Template will completely replace all metric settings in the target.
 Template will only override metrics that are common to both template and target.

Destination Targets

The table below shows the list of Database Instance targets to which this monitoring template will be applied.

Select Name	Type
<input type="checkbox"/>	Database Instance

TIP Applying a template will not update thresholds of metrics which have adaptive thresholds set on the destination target

Figure 3.7: Monitoring template : apply page

3.3 Simulation : Policy violation + corrective action

Previously, we have defined a monitoring template with associated corrective actions. In this part, we will generate policy violation in order to test our corrective action.

1. In the initial state, we can see in Enterprise Manager there are no violations in our system, see figure 3.8.

- If we click on the number of violation, a new page appears with a summary of the violation and the status of the execution of corrective action.

Policy Violation Details: Granting SELECT ANY TABLE privilege

Target Name: Target Type: Database Instance

This page shows objects in violation of this policy. Suppress the violations that you do not want to be included in the list of policy violations. Last Evaluation Aug 2, 2010 2:08:43 PM CEST

General

Severity Compliance Score (%) 76 Importance Normal Category Security Description Ensures SELECT ANY PRIVILEGE is never granted to any user or role

Objects with Violations

Objects with Violations 3
Objects with Suppressed Violations 0

Impact of Violation

The SELECT ANY TABLE privilege can be used to grant users or roles with the ability to view data in tables that are not owned by them. A malicious user with access to any user account that has this privilege can use this to gain access to sensitive data.

Recommendation

Never grant SELECT ANY TABLE privilege.

Select	Path	Grantee	Non-Compliant Since	Automated Corrective Action Status	Comments
<input type="checkbox"/>	SELECT ANY TABLE->ABECHE	ABECHE	Aug 2, 2010 2:08:43 PM CEST	Succeeded	
<input type="checkbox"/>	SELECT ANY TABLE->USER_TEMP	USER_TEMP	Aug 2, 2010 2:08:43 PM CEST	Succeeded	

Figure 3.10: Overview of succeeded corrective action

- We can have a look on the result of our script on the following figure.

```
1 REVOKE select any table FROM %context_value_grantee%
```

3.3. Simulation : Policy violation + corrective action

The screenshot shows the Oracle Enterprise Manager interface for a corrective action. The status is 'Succeeded'. The output log contains the following text:

```

SQL*Plus: Release 10.2.0.4.0 - Production on Tue Aug 10 09:20:55 2010
Copyright (c) 1982, 2007, Oracle. All Rights Reserved.

SQL> SQL> SQL> SQL> Connected.

Revoke succeeded.

SQL> SQL> SQL> Disconnected from Oracle Database 10g Enterprise Edition Release 10.2.0.4.0 - 64bit
Production
With the Partitioning, Data Mining and Real Application Testing options
    
```

Figure 3.11: sqlplus : result of corrective action

6. After 5 minutes, we can see a return to a normal state due to the success of our automatic script. In our test system, the schedule time is 5 minutes to accelerate the test procedure. In a real production system, the scheduling is set to 24 hours.

The screenshot shows the Oracle Enterprise Manager interface for the Compliance tab. The search results are empty, indicating that no violations were found. The search criteria are as follows:

- Target Type: Database Instance
- Most Recent Violation within: 6 Days
- Ignore suppressed violations:

Figure 3.12: Compliance tab : return to normal state

In our production system, we decide to fix automatically some of the policy violations. Annex 3 shows the list of policies we have decided to treat.

3.3. Simulation : Policy violation + corrective action

Chapter 4

Notification rules and target grouping

Generally, notification rules are used to decrease the reaction time of the administrator. It is more convenient to receive an email when problem occurs than going to Enterprise Manager to see it.

4.1 How notification rules works?

There are two distinct processes, **notification rules** and **notification schedule**. A notification rule is a set of conditions that determine when a problem occurs (for example: target down, critical state for a metric) and a notification schedule which determines when an administrator receives a notification and at which address(es). Following schema shows the internal mechanism of a notification rule:

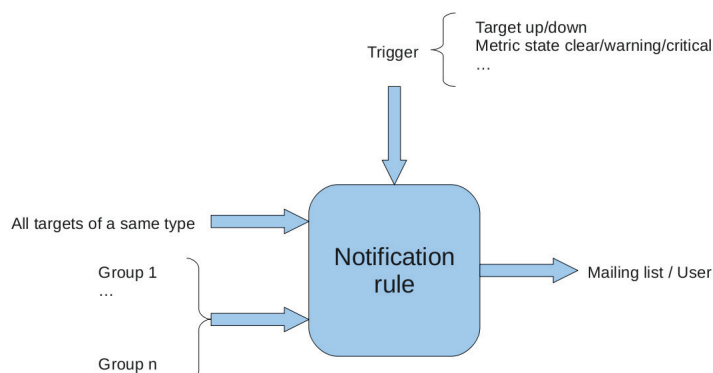

Figure 4.1: Notification rules : internal mechanism

During internal investigation, we have found that some alerts don't trigger any email notification. This was due to some of groups were not bind with notification rules. In order to

clean up the situation, we agreed to regroup the targets and re-apply the notification rules to new groups.

4.2 New grouping of targets

Some groups in Enterprise Manager were not based on logical grouping and had redundant informations in different groups. In order to standardize the grouping, a proposal was made based on the new grouping in the tab.xml (all databases schema) and service catalog. Following schema shows the new grouping approved by our group.

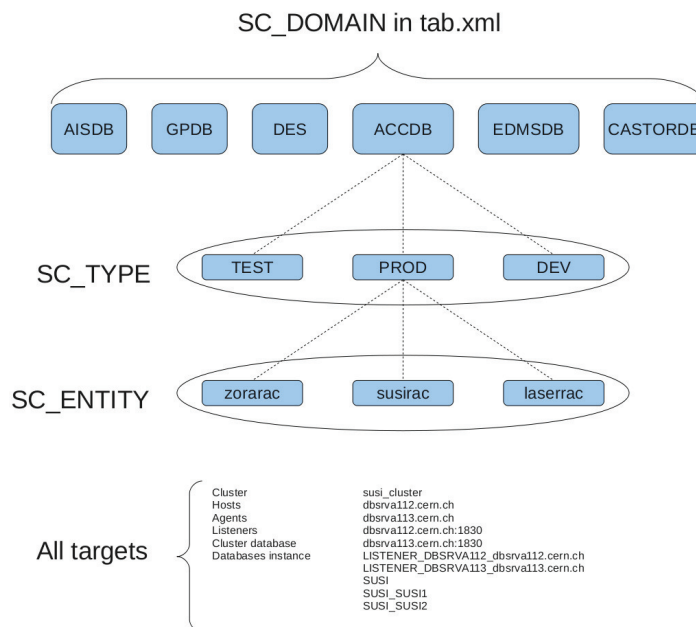

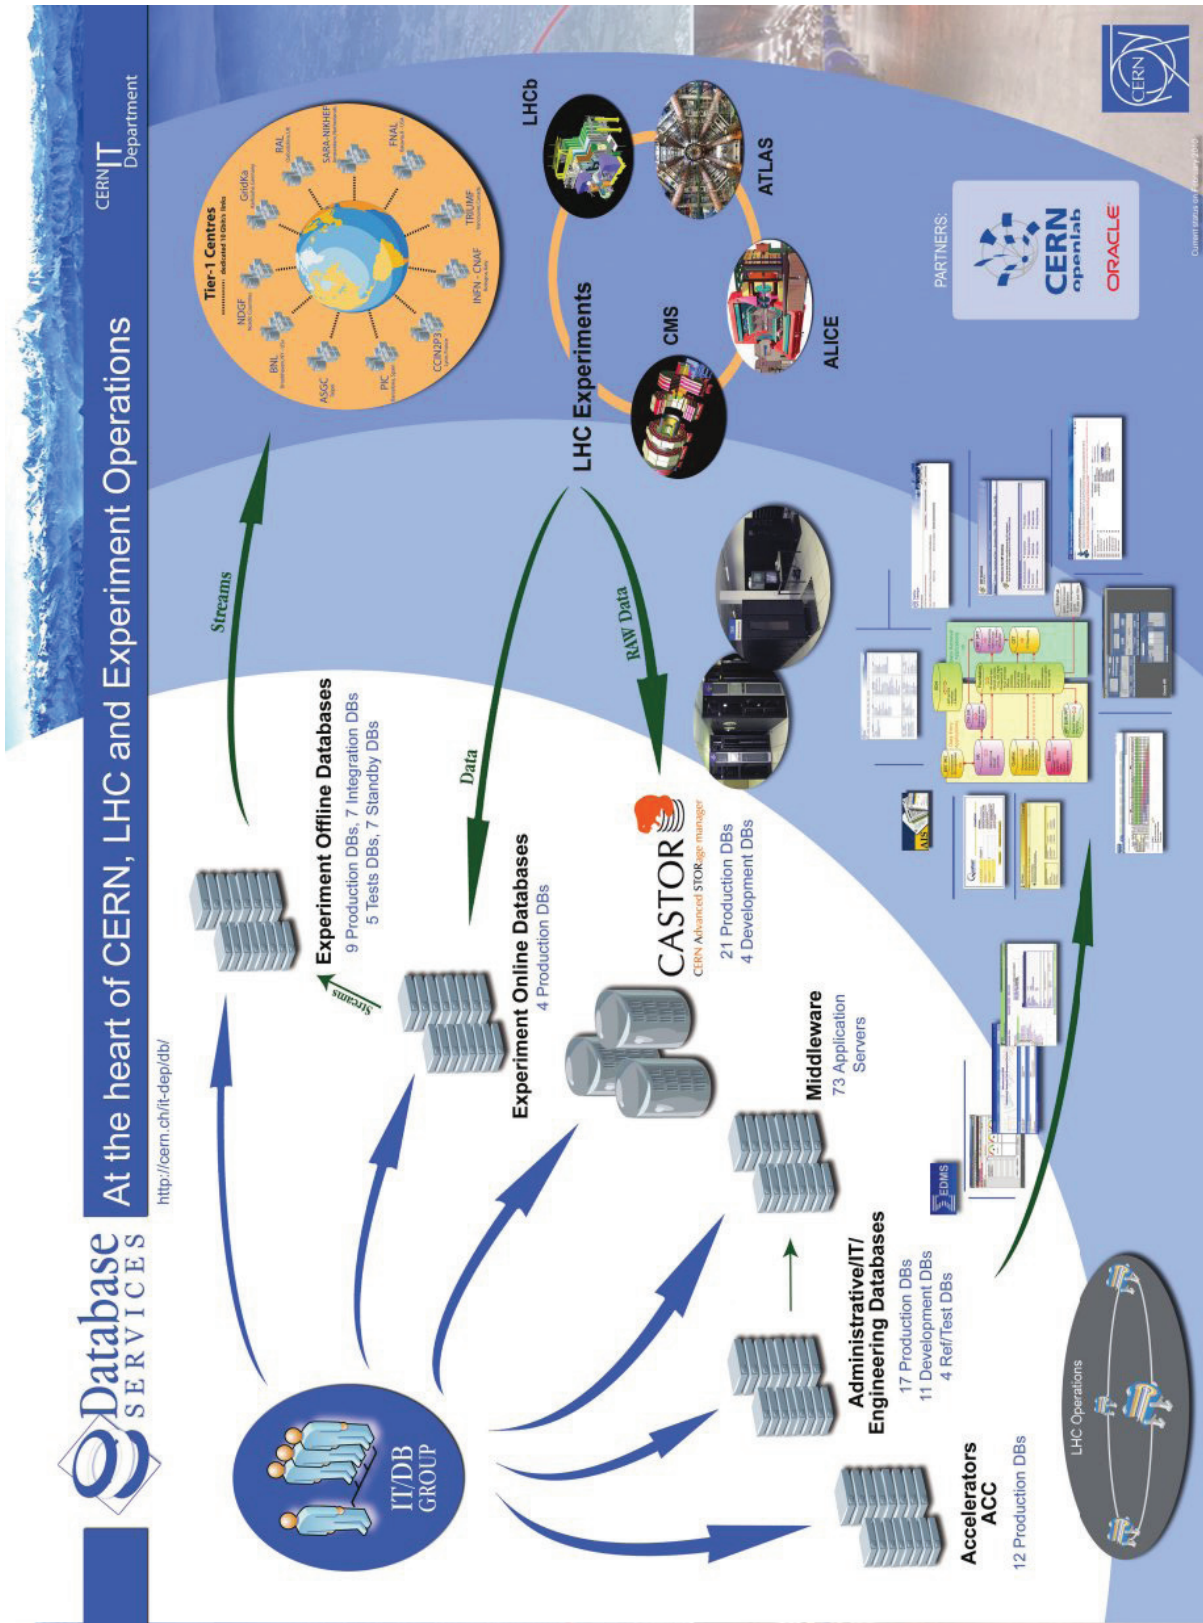

Figure 4.2: New grouping model
